Corpus co-mention network with DepMap CRISPR co-dependency

Gene-level view; spelling variants merged. Edge width counts distinct papers. Drawn: edges between a protein of interest and its strongest partners (52 partners in the corpus); edges among partners are omitted. DepMap r (coloured when $|r| \geq 0.15$): Pearson correlation of CRISPR gene effect over 1,208 cell lines. Kd, Ki: tightest value reported for the wild-type protein. This pair was forwarded in 2 of 2 histone-chaperone runs, once as a canonical-track pick in the wildcard evaluation.
